

***PERCINA NASUTA* AND *P. PHOXOCEPHALA* SYMPATRIC IN LEE CREEK**

Albert P. Blair

Natural Sciences Faculty, University of Tulsa, Tulsa, Oklahoma

July 1, 1971, I caught a large example of *Percina phoxocephala* in a shallow riffle about ¼ mile below the mouth of Webber Creek. Although I have taken *P. nasuta* in this riffle and upstream and downstream from this riffle, I have not caught *P. phoxocephala* in Lee Creek other than this one time nor do I know of other records for Lee Creek.

Moore and Paden (1) reported *P. phoxocephala* from their Illinois River station 1 (near Watts) and stations 6, 7, and 8 (near the mouth of the river) but at no intervening stations. I took one example of *P. phoxocephala* at Round Hollow State Park July 26, 1971, and two examples near the mouth of Black Fox Creek (but in the Illinois River) Aug. 5, 1971. Evidently, then, *P. phoxocephala*, although rare, is present in the intermediate and upper reaches of the Illinois River.
